

ALSET® LED Lighting teamed up with the BP Gasoline Station in Algonquin, IL for this amazing, energy saving project. ALSET® LED supplied 99.5 watt LED canopy fixtures, replacing the previous 320 watt pulse-start, metal halide fixtures. These canopy fixtures are brighter and yield a 60,000 hour lifespan while only using a third of the energy. This created a safer and more inviting environment for customers. Additionally, working with Com Ed and the local Trade Ally Verde Solutions, this station was about to receive a 70% of the installed cost rebate from the local utility. With results this dramatic, before-and-after designations are not necessary!

From any angle, this new LED lighting installation is a winner!
